\title{ Designing and using mysql
database for human resource
management}
\begin{document}
\maketitle{}
\section{abstract}
this paper, we would like to
discuss the methods and
ideologies used to create a
database
to be used for Human Resource
purposes. Because we want this
database to be accessible
anywhere at any time, it is safe
to conclude that an
internet-based (web-based)
database
would work best, therefore we
chose MySQL as the database
management system. Before
diving deep into the making of
the database itself, it is
important to understand certain
basics of database design and the
phases of the database life cycle
itself. This paper will
conclude on a few of the basic
things to understand before
designing a database for Human
Resource Management on MySQL
